FROST

- NEOBOND Frost series combine a fascinating imitation of Arctic frost decor and a look of a fine layer of ice. Neobond Frost panels allow to create a versatile and exquisite design, providing a lightly rough texture with a matt glaze. Those spectacular frost low-reflective colours are perfect for brands and projects defined by luxury, and could add a glamorous chic to any project, especially such as boutique hotels, art galleries or high-end residences.

-
- Each colour in current colour chart is represented for display purposes only. Please check the actual colour accordance to your project with our sample.
 - Colour differences may occur between panels from different production batches. The entire required amount of material for the project must be ordered as one batch.
 - To avoid differences in gloss and reflection, composite panels have to be installed in the same direction, as indicated by the arrows on the protective film.
 - Product series available as NEOBOND, NEOBOND/FR, NEOBOND/A2 (colour variation may occur between different product types, due to different production processes. It is recommended not to mix different product types, if colour consistency is required).
